1. (a) `transposeMatrix(A, m, n)`: transpose the $m \times n$ matrix A and return the result

Let $A^T = B$. Since $B_{ij} = A_{ji}$, the code below returns transpose of matrix A.

```
double** transposeMatrix(double **A, int m, int n) {
    double** B = allocateMemory(n, m);

    for (int i = 0; i < m; i++)
        for (int j = 0; j < n; j++)
            B[j][i] = A[i][j];

    return B;
}
```

$$A = \begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix}$$

$$\therefore A^T = \begin{bmatrix} 1 & 4 \\ 2 & 5 \\ 3 & 6 \end{bmatrix}$$

(a) Equation

```
(a) Transpose Matrix
(b) Normalise Vector
(c) Calculate Length
(d) Scale Matrix
(e) Multiply 2 Matrices
(f) Add 2 Matrices

1 2 3
4 5 6

A =
1.000000 2.000000 3.000000
4.000000 5.000000 6.000000

A^T =
1.000000 4.000000
2.000000 5.000000
3.000000 6.000000
```

(b) Result Image

Fig. 1: `transposeMatrix()`

(b) `normalizeVector(v, n)`: normalise the n-dimensional vector $\mathbf{v}$ and return the result
Since normalised vector is calculated by dividing all entries by its length, the code below returns the normalised vector $\mathbf{v}$.

```
double** normalizeVector(double** v, int n) {
    double** w;
    double len = calculateLength(v, n);

    w = allocateMemory(n, 1);
    for (int i = 0; i < n; i++)
        w[i][0] = v[i][0] / len;

    return w;
}
```

$$\mathbf{v} = \begin{bmatrix} 1 \\ -1 \end{bmatrix}$$
$$||\mathbf{v}|| = \sqrt{(1)^2 + (-1)^2}$$
$$\therefore \hat{\mathbf{v}} = \begin{bmatrix} \frac{1}{\sqrt{2}} \\ -\frac{1}{\sqrt{2}} \end{bmatrix}$$
$$\hat{\mathbf{v}} \approx \begin{bmatrix} 0.707107 \\ -0.707107 \end{bmatrix}$$

(a) Equation

Enter the element of matrix :
1
-1

v =
1.000000
-1.000000

Normalised v =
0.707107
-0.707107
```

(b) Result Image

Fig. 2: `normalizeVector()`

(c) `calculateLength(v, n)`: calculate the length of the n-dimensional vector $\mathbf{v}$ and return the result

Since length of vector is calculated by square root of the sum of the square of all entries, the code below returns the length of vector $\mathbf{v}$.

```
double calculateLength(double** v, int n) {
    double len = 0.0;

    for (int i = 0; i < n; i++) {
        len += v[i][0] * v[i][0];
    }
    len = sqrt(len);

    return len;
}
```

$$\mathbf{v} = \begin{bmatrix} 1 \\ 7 \\ 4 \end{bmatrix}$$

$$||\mathbf{v}|| = \sqrt{1^2 + 7^2 + 4^2}$$

$$||\mathbf{v}|| = \sqrt{66}$$

$$||\mathbf{v}|| \approx 8.124038$$

(a) Equation

```
(a) Transpose Matrix
(b) Normalise Vector
(c) Calculate Length
(d) Scale Matrix
(e) Multiply 2 Matrices
(f) Add 2 Matrices

4

v =
1.000000
7.000000
4.000000
Length of V = 8.124038
```

(b) Result Image

Fig. 3: `calculateLength()`

(d) `scaleMatrix(A, m, n, c)`: scale the $m \times n$ matrix A with scalar c

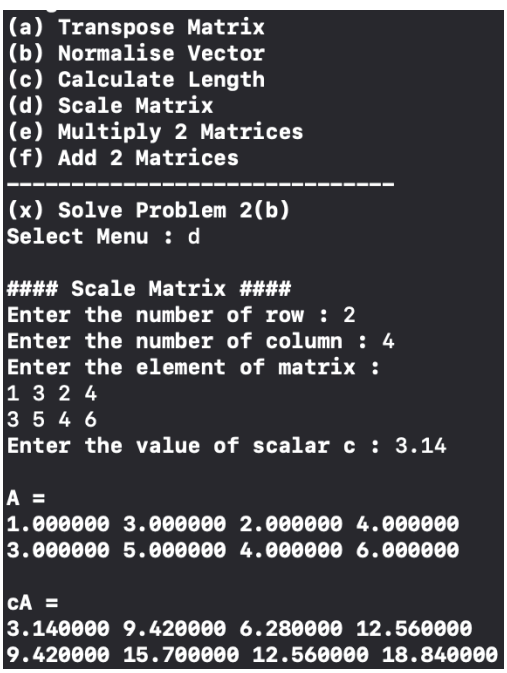
The code below returns the matrix A scaled by c by multiplying all entries in A by c.

```
double** scaleMatrix(double** A, int m, int n, double c) {
    double** cA = allocateMemory(m, n);
    for (int i = 0; i < m; i++) {
        for (int j = 0; j < n; j++) {
            cA[i][j] = c * A[i][j];
        }
    }

    return cA;
}
```

$$3.14 \begin{bmatrix} 1 & 3 & 2 & 4 \\ 3 & 5 & 4 & 5 \end{bmatrix} = \begin{bmatrix} 3.14 & 9.42 & 6.28 & 12.56 \\ 9.42 & 15.7 & 12.56 & 18.84 \end{bmatrix}$$

(a) Equation



(b) Result Image

Fig. 4: `scaleMatrix()`

(e) `multiplyTwoMatrices(A, m, n, B, l, k)`: for $m \times n$ matrix A and $l \times k$ matrix B, calculate and return AB. Return `null` if multiplication is impossible.

The code below returns the multiplication between matrix A and B or `NULL` if multiplication is impossible.

```
double** multiplyTwoMatrices(double** A, int m, int n, double** B, int p, int q) {
    if (n ≠ p) return NULL;

    double** AB = allocateMemory(m, n);

    for (int i = 0; i < m; i++) {
        for (int j = 0; j < q; j++) {
            AB[i][j] = 0;
            for (int k = 0; k < p; k++) {
                AB[i][j] += A[i][k] * B[k][j];
            }
        }
    }

    return AB;
}
```

$$\begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix} \begin{bmatrix} 1 & 2 & 3 & 4 & 5 & 6 & 7 \\ 8 & 9 & 10 & 11 & 12 & 13 & 14 \\ 15 & 16 & 17 & 18 & 19 & 20 & 21 \end{bmatrix} = \begin{bmatrix} 62 & 68 & 74 & 80 & 86 & 92 & 98 \\ 134 & 149 & 164 & 179 & 194 & 209 & 224 \end{bmatrix}$$
